Enterprise / Mayflower restart notes — 2026-07-27

What is already done
- A corrected review set exists in this folder.
- Main review page: `generated/enterprise-mayflower-concepts/index.html`
- Corrected PDF: `enterprise-mayflower-corrected-concepts-v2.pdf`
- Two concept layouts were preserved as SVG/PNG:
  - `enterprise-mayflower-concept-22-unit.svg` — balanced 22-unit site-condo concept
  - `enterprise-mayflower-concept-18-20-unit.svg` — lower-density premium/open-space concept

Current working assumptions shown in the concept set
- Approx. parcel size: **~5.03 acres**
- Approx. Mayflower frontage/access: **~101 ft**
- Access is assumed from the **west/left side lower leg** on Mayflower St
- A **NW→SE creek / sewer easement corridor** cuts diagonally through the tract and is being treated as a real no-build/common-area spine
- This is framed as a **horizontal condo / site-condo** style project rather than a standard fee-simple lot subdivision
- All drawings are marked **concept only / not survey-grade**

Concept A — 22 units
Positioning in the file:
- “Balanced” plan
- Tries to maximize count without forcing a 25-unit layout

Why it was probably kept alive:
- Better unit count than the premium layout
- Still leaves a central green and respects the corridor
- Explicitly described as likely better than 25 units for parking, stormwater, and fire access pressure

Likely tradeoff:
- This is the more aggressive plan, so it will be the first one to fail if parking ratios, fire turnaround, utility separation, or stormwater storage get tight

Concept B — 18 to 20 units
Positioning in the file:
- “Premium / open-space” plan
- Larger central amenity lawn
- Optional 19th and 20th units only if circulation still works cleanly

Why it was probably kept alive:
- Easier parking and guest circulation
- More room to respect corridor / drainage issues
- Lower entitlement and engineering pressure
- Better premium feel if the resale / investor angle matters

Likely tradeoff:
- Lower density means the land basis has to support fewer saleable units

Biggest unresolved items before choosing a direction
1. **Survey / CAD reality check**
   - Need a proper boundary, frontage confirmation, and exact easement geometry
2. **Zoning / entitlement path**
   - Need to confirm whether this should be pursued as site condos, townhouse-style lots, cottage lots, or another structure under Enterprise rules
3. **Fire access / turning**
   - The internal loop/drive needs a real fire review before any unit count gets treated as credible
4. **Parking math**

   - Unit mix, guest parking, and aisle widths likely decide whether 22 survives
5. **Stormwater / drainage**
   - The corridor may help, but detention and outfall still need civil input
6. **Utilities**
   - Sewer/water tie-in, easement conflicts, and service routing need confirmation
7. **Product / market choice**
   - Best path may depend on whether Clint wants workforce/flight-school demand, investor resale product, or a more premium tiny-home/cottage community

Best next steps from here
Option 1 — Decision memo (fastest)
Turn the current concepts into a tighter 1-2 page recommendation:
- 22 vs 18-20
- likely parking assumptions
- likely product mix
- what to ask surveyor / city / civil / fire

Option 2 — Feasibility checklist pack
Build a due-diligence packet with:
- questions for city planning
- questions for fire marshal
- questions for survey/civil
- red-flag list that could kill the deal or force the lower density option

Option 3 — Investor/deal framing
Translate this into:
- rough unit-count economics framework
- how to present the tract
- what density target to underwrite first

My working recommendation
If we are restarting cold, the smartest move is:
1. treat **18-20 units as the base case**,
2. keep **22 units as the upside case**, and
3. build the next round around the specific kill-tests: frontage, fire access, parking, stormwater, and entitlement structure.

That keeps us from overcommitting to a count the site may not actually support.
