

Enterprise / Mayflower – Path #1 vs Path #2

Date: 2026-07-27

This is a practical side-by-side of the two most likely entitlement paths for the Mayflower tract.

Path #1 – PRD / planned residential route

What it is

A **planned residential development** approach that asks the City to review the tract as a coordinated residential project instead of a normal lot-by-lot subdivision.

Why this path makes sense here

This tract has several things that make conventional subdivision logic awkward:

- only about **101 feet of frontage** on Mayflower
- likely **one practical entrance**
- a diagonal **creek / sewer easement corridor** cutting the site
- likely need for **shared open space**, shared circulation, and a controlled overall layout
- the product is more like a **designed cottage community** than random standalone lots

PRD is the cleaner story if we want to say:

- this is one integrated development,
- the open-space spine is intentional,
- the internal layout is coordinated,
- the City should judge the whole design together.

What helps this path

Enterprise PRD rules are meant to allow:

- design flexibility,
- housing variety,
- protection of natural/drainage features,
- more efficient infrastructure patterns.

That fits this site pretty well.

The problem with this path

The ordinance appears to set **10 acres** as the normal PRD minimum.

This tract is only about **5.03 acres**.

There is language suggesting smaller tracts **may be considered**, but that is not automatic.

So this path depends heavily on whether staff and the Commission are open to treating this as a justified exception-sized PRD.

Best argument for approval

If we pursue PRD, the strongest argument is:

- the parcel is constrained by frontage and the creek/easement corridor,
- shared design is better than forcing conventional lots,
- the plan creates usable common space,
- the project may produce a better-looking and better-functioning development than standard zoning would,
- the site constraints make the 10-acre threshold impractical in this specific case.

What unit count feels realistic under PRD

- **18 units** = best base case

- ****20 units**** = possible if parking / fire / drainage all work
- ****22 units**** = aggressive and should be treated as upside only

PRD gives the most flexibility, but it does ****not**** magically solve fire access, parking, or drainage.

Main risks

- City says no because tract is too small for PRD
- City says use a standard zoning path instead
- neighbors / Commission see it as too dense for the site
- PRD process could be slower and more political than a simpler approval path

What this path would need from us

Likely:

- a better concept plan
- a narrative explaining the community benefit and why PRD is appropriate
- open-space plan
- circulation / parking concept
- drainage / utility concept
- likely stronger presentation materials than a routine small-site submittal

My take on Path #1

This is probably the ****best design-story path****.

It is ****not**** the safest procedural path.

If the City is receptive, PRD could be the best fit.

If staff is not receptive, this path can die early.

Path #2 – multifamily / condo-style development plan route

What it is

This path treats the project more like a ****small multifamily residential development****, possibly in ****condominium/site-condo ownership form****, with City review focused on:

- building layout
- parking
- circulation
- fire access
- drainage
- infrastructure

Instead of asking for special planning flexibility first, this route asks:

****Can this physically and legally function as a small multifamily-style residential site?****

Why this path makes sense here

The current concept already behaves more like a coordinated multifamily campus than a normal subdivision:

- one entrance
- shared internal drive
- common green/open space
- clustered units
- likely shared infrastructure logic

Also, the Cottage Development rules appear to create a count problem because of the ****10 non-frontage dwelling lot**** limit.

That makes a multifamily/condo framing potentially cleaner than trying to wedge this into cottage-subdivision language.

What helps this path

Enterprise code appears to already contemplate:

- multifamily developments,
- development-plan review,
- subdivision/resubdivision tied to multifamily,
- review of open spaces, circulation, drainage, and infrastructure together.

That makes this route feel more grounded in the way the site is actually laid out.

The main issue with this path

This route gives ****less conceptual flexibility**** than PRD.

You still have to satisfy the City on practical site design.

That means the tract may get squeezed by:

- parking ratios
- visitor parking
- fire lane / turnaround requirements
- building spacing
- open-space expectations
- stormwater
- utility routing around the easement/corridor

What unit count feels realistic here

This path is probably where the math gets more honest.

My current read:

- ****18 units**** = most credible starting point
- ****20 units**** = possible if unit mix stays tight and layout is efficient
- ****22 units**** = maybe, but this is where parking and circulation could start breaking the site

If the units are mostly 1BR and parking can stay efficient, 20 has a shot.

If there is a meaningful 2BR mix, pressure goes up quickly.

Why condo/site-condo form still matters here

Even if the City reviews it as a multifamily-style site,

****ownership structure still matters**** because Clint may not want this to be a plain apartment project.

A condo or site-condo style approach can help frame it as:

- individually marketable units or pads,
- coordinated common ownership/maintenance of open space and access,
- one planned project rather than random subdivided lots.

Main risks

- zoning may not currently allow the use without rezoning or another approval
- City may still push it toward PRD or another special path
- parking/fire/drainage may cap the real yield lower than the sketch suggests
- if the City interprets the form too much like a dense apartment project, expectations may tighten

What this path would need from us

Likely:

- zoning confirmation
- a clearer unit/product description
- parking count by unit mix
- fire/circulation concept
- better drainage understanding
- decision on whether ownership is rental, condo, or site-condo

My take on Path #2

This is probably the ****most practical first screening path****.

It is less elegant than PRD, but it may be the fastest way to learn whether the site can actually carry 18-20 units.

If the City says "this is basically multifamily with a coordinated site plan," that may be the most direct route.

Straight comparison

Path #1 PRD

****Best for:****

- flexibility
- custom site design story
- emphasizing community/open-space design
- avoiding forced conventional-lot logic

****Weakness:****

- site is under the typical 10-acre PRD minimum
- more discretionary / political

Path #2 Multifamily / condo-style development plan

****Best for:****

- practical screening
- faster reality check on density
- layout / parking / fire / drainage testing
- aligning with the actual physical concept

****Weakness:****

- less design flexibility
- may expose hard unit-count limits sooner

My recommendation right now

If we are sequencing this smartly:

First ask the City about Path #2

Use it as the ****fastest reality test****.

Ask whether the tract can be reviewed as a small multifamily / condo-style coordinated residential site.

Keep Path #1 in reserve as the strategic fallback / upgrade path

If staff says the site needs more flexibility than the straight multifamily path allows, then we pivot to:

- ****"Would you entertain a sub-10-acre PRD here because of the site constraints and integrated design?"****

So my current order is:

1. ****Test Path #2 first****
2. ****Use Path #1 if staff says a custom planning path is needed****

That is the cheapest way to find out whether this is an 18-unit real project or just a good-looking sketch.

What I'd do next if you want me to keep going

1. Turn this into a ****tight 1-page city conversation brief****
2. Then build a ****unit-count parking test sheet**** for 18 / 20 / 22 units
3. Then revise the concept framing around whichever path looks stronger
